I PROJECT GRILL FLAME HISTORY

Project Grill Flame is a DoD/Intelligence program set up for the following purposes:

- To assess the potential for U.S. applications of developments in parapsychology ("ESP," Psi, Psychoenergetics).
- To determine the threat potential of corresponding Soviet/East Bloc efforts.

Major Decision Points

- 1972 - Startup of a continuous effort, still ongoing, involving SRI International as major contractor, and a number of agencies as sponsors (CIA, FTD, MIA, DIA, etc.).*
- 1978 - Effort compartmentalized under codeword GRILL FLAME.
- 1979 - In-house applications program set up by Army's Intelligence and Security Command (INSCOM).
- 1980 - Joint Services Integrated Program set up under single-agency (DIA) management to handle external contracts.

* See funding chart, next page.

II GRILL FLAME REMOTE VIEWING (RV) PROGRAM

A. RV Phenomenon--Definition

Remote viewing (RV) is the ability of certain individuals to access and describe, by means of mental processes, information blocked from ordinary perception by distance or shielding. Targets for remote viewing have ranged from small objects in nearby light-tight cannisters to remote technical facilities at intercontinental distances, from numbers generated at random in a computer, [REDACTED]

SG1A

B. RV Application to Intelligence Requirements

Since the early 1970s, SRI International has been tasked by the DoD/Intelligence communities to assess the potential of remote viewing for intelligence applications, both to enhance the potential for U.S. applications, and to provide data that would be useful in assessing the threat potential of corresponding Soviet/East Bloc applications. To carry out this task, SRI has responded to operational requirements set by intelligence community representatives monitoring the progress of the work.

The investigations have shown that remote viewing, both by SRI and Army INSCOM personnel, has in many cases provided meaningful descriptions of, e.g., East-bloc targets of interest to the intelligence community. Evaluation by appropriate intelligence community specialists indicates that a remote viewer is able by this process to generate useful data corroborated by other intelligence data. As is generally true with other human sources, the information is fragmentary and imperfect, and therefore should not be relied on alone but is best utilized in conjunction with other resources. Although efforts to establish the precise degree of

SECRET

SECRET

accuracy and reliability are not yet complete, the data generated by the RV process appears to exceed any reasonable bounds of chance correlation or acquisition by ordinary means and therefore constitutes an exploitable information source.

Successful operational viewings carried out by the SRI team for the DoD/Intelligence communities include:

- A secret NSA facility, including codeword retrieval.
- Soviet R&D facility at Semipalatinsk (PNUTS).

SG1A

Results from some of these tests are presented here as examples.

CLIENT: CIA

SITE: Semipalatinsk, USSR, URDF-3 (PNUTS)

SITE/EVENT DESCRIPTION:

URDF-3 is an unidentified R&D facility located at Semipalatinsk, USSR; also known in the intelligence community as PNUTS.

Site is characterized by:

- (1) A large rail-mounted crane, several stories tall.
- (2) Large metallic gores which comprise a sphere (or spheres) buried underground.

INFORMATION PROVIDED TO REMOTE VIEWER:

- (1) Coordinates of the site (latitude and longitude in degrees, minutes and seconds).
- (2) Viewer told site was an R&D facility in the Soviet Union.
- (3) Viewer and interviewer otherwise blind as to site.

RESULT:

Remote viewer narrated a description which was tape recorded, and remote viewer rendered (among others) drawings shown on following two pages, indicating:

- (1) The presence of the large crane, correctly identified as to size.
- (2) Assembling of large spheres from metallic gores.
